

HEALTH

Noise levels from turbines meet **World Health Organisation (WHO)** recommendations for residential areas.

There is **no evidence** "that the audible or sub-audible sounds [including infrasound] emitted by wind turbines have **any direct adverse physiological effects**", concluded a study, 'Wind Turbine Sound and Health Effects', conducted in 2009 by a panel of medical professionals from the US, Canada, Denmark, and UK.

The most audible **sound** of wind turbines is a **light swishing** - and usually the wind itself is louder.

Wind energy emits **no particles**, unlike fossil fuels, which severely affect human health.
